

Adabas SAF Security

KEEP YOUR MAINFRAME DATA SAFE

TAKE CONTROL BY USING A SINGLE ADABAS SECURITY SYSTEM

Secure your Adabas data more easily than ever with Adabas SAF Security.

Adabas SAF Security gives you maximum protection of your Adabas data.

Need to secure your mainframe Adabas data? Then here's your solution. Adabas SAF Security is specifically designed to help you secure Adabas data and determine who does what with your data. Although most products come with built-in utilities to protect data, anyone who uses more than one product knows that maintaining multiple security products can become cumbersome. Additionally, standard products aren't often an exact fit and adapting them can be costly.

Adabas SAF Security helps you overcome these issues.

Using Adabas SAF Security, you can:

- Gain maximum control over mainframe Adabas data
- Count on the maximum flexibility in securing your system
- Monitor SAF operations and all aspects of your system with greater ease

How it works

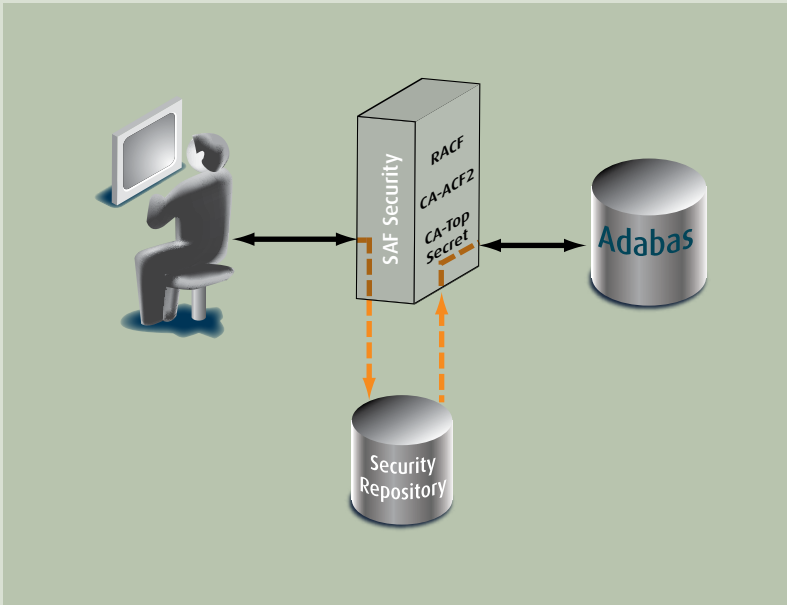

Adabas SAF Security validates each end user using RACF, TOP Secret or ACF2 security definitions before allowing access to Adabas.

An online administrator provides a single point of control for all user security, monitoring and changes.

Key features

- The ability to identify, validate and control individual users to ensure maximum control of your data.
- Cipher codes and passwords are held in RACF (INSTDATA) and inserted at the target database, so there's no longer a need to carry the cipher or password "on the wire" or to hard-code ciphers or passwords in the application.
- The online administration program informs you of every aspect of your system's inner workings.

ADABAS SAF SECURITY

Your benefits

- Maximize protection

Adabas commands are classified as “access” or “update” and user-validated to ensure appropriate permission for the file in question. You can differentiate between a user running CICS and one running TSO, or if a user is running production CICS versus test CICS. By using a different resource class, Adabas SAF Security makes a distinction even when two user IDs are the same.

- Improve re-use

Re-use security information already defined in a third-party security package, such as user names and IDs. Adabas-specific information can be added to existing security definitions within the third-party product.

- Increased flexibility

You can customize the global options of the assembled parameter module, or you can override some parameters for databases. This means you secure your system in the way you want.

- Simplify monitoring

Using the online administration program, a standard Natural application, you can monitor SAF operation in any nucleus. You can check cache efficiency, review parameters or even log users off—so you know what’s going on with your system and gain total control of your data.

Protect your Adabas data

Why risk a possible security breach? Take control of your security with Adabas SAF Security, offering the tightest and most reliable control possible over your Adabas data.

Software AG Communities

The Software AG Developer Network includes an Adabas community to keep you connected to Adabas users and experts around the world. By registering for the Adabas community, you can participate in discussion forums that enable you to exchange best practices, enhance productivity and improve your technical skills. Registered members can also subscribe to the TECHniques newsletter, which offers technical tips and tricks. Membership to the developer network is FREE. For more information, please visit:

<http://developer.softwareag.com>

Worldwide User Groups

Our strong network of worldwide user groups also helps build Adabas and Natural skills. Through a local user group, you can exchange ideas and discuss technology issues, experiences and concerns. Many groups offer classes that provide product hints and tips. Through ServLine24, regional meetings and annual International Conferences, user group members have access to a broad product knowledge base. To learn more, please visit:
