

Welcome to the future of business process innovation

Professional migration to ARIS 9 with Scheer

Discover the new user interface and improved functions for collaboration, dynamic publishing, analysis and tables. The new functions make the administration and control of your business processes and your organization's architecture simpler than ever.

ARIS 9 is the first important upgrade with significant changes to the fundamental architecture since the launch of ARIS 7 in 2005.

Our experts will lead you successfully through the technical upgrade and migration process of your existing ARIS installation and possess the necessary product know-how and experience to ensure that the process satisfies your particular requirements.

We offer support in the following areas:

1. ARIS 9 Readiness Assessment

The first step on your way to ARIS 9 is the readiness assessment. We analyze more than just technical questions and system requirements. The assessment includes all contents, training and roll-out questions as well as the upgrading of existing customer specific solutions: for example ARIS scripts, reports and technical interfaces.

2. ARIS 9 Installation and Migration

Before the installation we identify and save all available data such as ARIS databases, filters, templates, dashboards and scripts.

The next step is the installation of ARIS 9 and the migration of the saved data. Everything you created with the previous ARIS version will be migrated into the ARIS 9 environment.

After this step we install the new User Management Component (UMC) which mirrors the new "domain" or "tenant" architecture of ARIS 9.

The biggest advantage of this user administration function is that administrators can allocate client licenses directly to users, thus saving a lot of time and effort.

The final step in the installation process includes comprehensive tests and the documentation of all customer specific installation details

3. ARIS 9 Enablement

These services are oriented around the results of the readiness assessment and your time scales. For example, we offer:

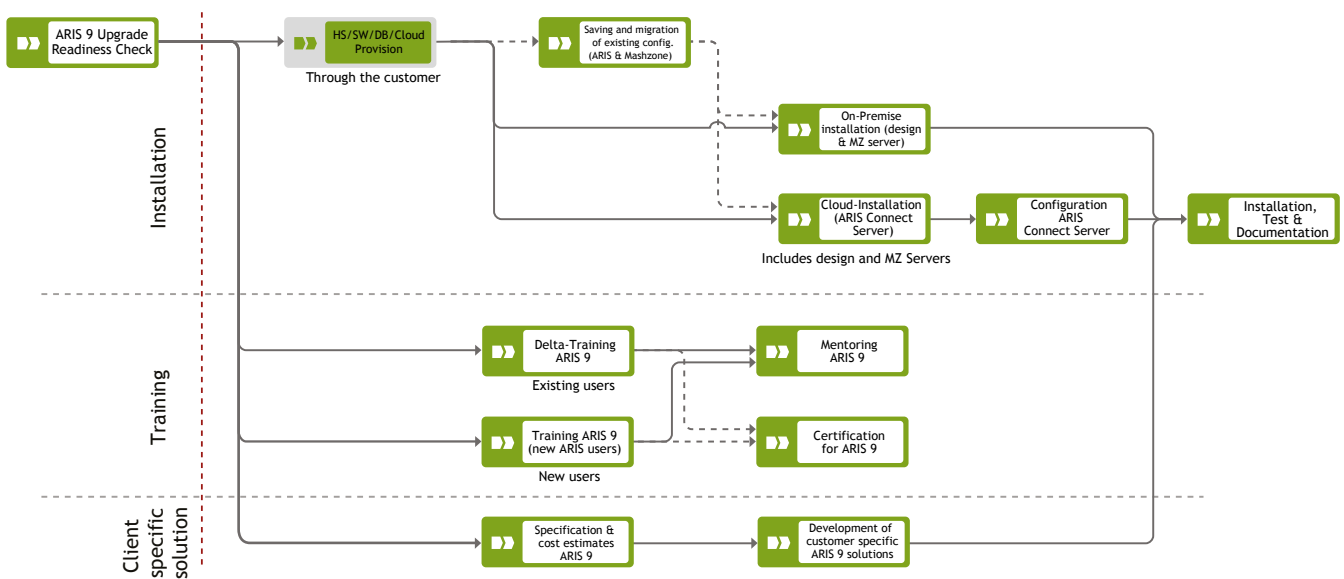

- 2 days delta training for experienced ARIS 9 users
- Basic and further training for new ARIS users
- Supervision (mentoring) of further knowledge transfer during, or after, the project

All training measures are tailored to your particular project requirements and planning.

4. Upgrade and Migration of client specific ARIS solutions

Our clients usually run one or more specific ARIS solutions, ranging from scripts or reports up to complex technical interfaces.

We know how important it is to maintain individual settings and reports so they can continue to be used. For this reason, during migration projects we offer a detailed analysis of your customer specific solutions and create specifications and cost estimates. If you decide to upgrade your customer specific solution we will run the project in line with the specifications and test and implement the solution in your environment. Above and beyond this we will create complete and exact documentation which will simplify and speed up future upgrades.

Professional upgrade and migration to ARIS 9
